Safety regulations for electrostatic manual powder spraying equipment

1 Safety symbols (Pictograms)
This chapter sets out the fundamental safety regulations that must be followed by the user and third parties using the powder spraying equipment. These safety regulations must be read and understood before the powder spraying equipment is used. The following warnings for ITW Gema operating instructions are shown here with their meanings. The general safety precautions must also be followed as well as the regulations in the operating instructions.

- **Danger!** Danger due to live electricity or moving parts. Possible consequences: Death or serious injury.
- **Warning!** Improper use of the equipment could damage the machine or cause it to malfunction. Possible consequences: minor injuries or damage to equipment.
- **Information!** Useful tips and other information.

2 Conformity of use
1. The manual powder spraying equipment is built exclusively for the normal application of powder coating according to current recognized technological and safety regulations.
2. Any other use is considered as non-conform. The manufacturer is not responsible for damage resulting from improper use of this equipment; the end-user alone is responsible. If the manual powder spraying equipment is to be used for other purposes or other substances outside of our guidelines then ITW Gema AG should be consulted.
3. Observance of the operating, service and maintenance instructions specified by the manufacturer is also part of conformity of use. The hand held powder spraying equipment should only be used, maintained and started up by trained personnel who are informed about and are familiar with the possible hazards involved.
4. Unauthorized modifications to powder spraying equipment exempts the manufacturer from any liability from resulting damage.
5. The relevant accident prevention regulations, as well as other generally recognized safety regulations, occupational health and structural regulations are to be observed. (see appendix “Standards”)
6. Furthermore the country-specific safety regulations must be observed.

3 Safety Technical Information

3.1 General information

The powder spraying equipment from ITW Gema is safe to operate and is built according to the latest technological specifications. This equipment can be dangerous if it is not used for its specified purpose. It should also be noted that because of this there exists:

- A danger to life and limb of the user or third party.
- A danger of damage to the equipment and other machinery belonging to the user.
- A hazard to the efficient operation of the equipment.

1. The powder spraying equipment should only be started up and used once the operating instructions have been carefully studied.
2. Before every Start-up check the equipment for operational safety (regular servicing is essential)!
3. Safety regulations BGI 764 and VDE regulations DIN VDE 0147, Part 1, must be observed for safe operation.
4. Safety precautions specified by local legislation must be observed.
5. The plug must be disconnected before the machine is opened for repair.
6. Only original ITW-Gema replacement parts should be used, because the explosion protection will also be preserved that way. Damage caused by other parts is not covered by guarantee.
7. If ITW-Gema powder spraying equipment is used in conjunction with machinery from other manufacturers then their safety regulations must also be taken into account.
8. Caution must be exercised when working with a powder/air mixture! A powder/air mixture in the right concentration is flammable! No smoking during powder coating.
9. As a general rule for all powder spraying installations, persons with pacemakers should never enter high voltage areas or areas with electromagnetic fields. Persons with pacemakers should not enter areas with powder spraying installations!

Warning! We emphasize that the customer themselves is responsible for safe operation of equipment. ITW-Gema is in no way responsible for any resulting damages.

3.2 Safety conscious working

Each person responsible for the assembly, start-up, operation, service and repair of powder spraying equipment must have read and understood the operating instructions and the “Safety” chapter. The operator must ensure that the user has had the appropriate training for powder spraying equipment and is aware of the possible sources of danger.

The control devices for the spray guns must only be set up and used inside of the zone 22, and the spray guns should be used in the zone 21.
3.3 Individual safety regulations for the operating firm and/or operating personnel

1. Any operating method which will negatively influence the technical safety of the powder spraying equipment is to be avoided.
2. The operator is under obligation to check the powder spraying equipment at least once a month for signs of external damage, defects or changes (including the operating characteristics) which could influence safety and to report them immediately.
3. The operator is obliged to check that the powder spraying equipment is only operated when in satisfactory condition.
4. As far as is necessary, the operating firm must ensure that the operating personnel wear protective clothing (e.g. facemasks).
5. The operating firm must guarantee cleanliness and an overview of the workplace with suitable instructions and checks in and around the powder spraying equipment.

3.4 Notes on special types of hazard

3.4.1 Power
High voltage equipment must not be opened - the plug must first be taken out – otherwise there is the danger of electric shock.

3.4.2 Powder
Powder/air mixtures can be ignited by sparks. There must be sufficient ventilation in the powder coating booth. Powder lying on the floor around the powder spraying device is a potentially dangerous source of slipping.

3.4.3 Static charges
Static charges can have the following consequences: Charges from people, electric shocks, sparking. Charges from objects must be avoided – see Earthing

3.4.4 Earthing
All electricity conducting parts and machinery found in the workplace (according to DIN VDE 0745, Part 102) must be earthed 1.5 m either side and 2.5 m around each booth opening. The earthing resistance of each piece of machinery must amount to 1 MΩ. The resistance must be tested on a regular basis. The condition of the machinery surroundings as well as the suspension gear must ensure that the machinery remains earthed. If the earthing of the machinery includes the suspension arrangements then these this must constantly be kept clean in order to keep the necessary conductivity. The appropriate measuring devices must be kept ready in the workplace in order to carry out the testing.

3.4.5 Compressed air
When there are to be longer pauses or stand-still times between working then the powder spraying equipment should be drained of compressed air. There is a danger of injury when pneumatic hoses are damaged and from the uncontrolled release and improper use of compressed air.

3.5 Prohibition of unauthorized conversions and modifications to equipment
All unauthorized conversions and modifications to powder spraying equipment are forbidden for safety reasons.
The powder spraying equipment should not be used if damaged, the faulty part must be immediately replaced or repaired. Only original ITW-Gema replacement parts should be used. Damage caused by other parts is not covered by guarantee.
Repairs must only be carried out by specialists or in ITW-Gema workshops. Unauthorized modifications can lead to personal injury and damage to machinery. The ITW Gema AG guarantee would no longer be valid.
4 Safety requirements for electrostatic powder coating

1. This equipment is dangerous if the instructions in this operating manual are not followed.

2. All electrostatic conductive parts and in particular the machinery, within 5m of the coating equipment must be earthed.

3. The floor of the coating area must conduct electricity (normal concrete is generally conductive).

4. The operating personnel must wear electricity conducting footwear (e.g. leather soles).

5. The operating personnel should hold the gun with bare hands. If gloves are worn, these must also conduct electricity.

6. The supplied earthing cable (green/yellow) must be connected to the earthing screw of the electrostatic powder spraying hand appliance. The earthing cable must have a good metallic connection with the coating booth, the recovery unit and the conveyor chain and with the suspension arrangement of the objects.

7. The electricity and powder supply to the hand guns must be set up so that they are fully protected against heat and chemical damage.

8. The powder coating device may only be switched on, once the booth has been started up. If the booth cuts out then the powder coating device must be switched off.

9. The earthing of all electricity conducting devices (e.g. hooks, conveyor chains) must be checked on a weekly basis. The earthing resistance must amount to $\leq 1 \, \text{M}\Omega$.

10. The control device must be switched off if the hand gun is cleaned or the nozzle is changed. The control device is also to be switched off when filling powder, so that ex atmosphere is not produced unnecessarily.

11. When working with cleaning agents there may be a risk of hazardous fumes. The manufactures information must be observed when using such cleaning agents.

12. The manufacturers instructions and the applicable environmental requirements must be observed when disposing of powder lacquer and cleaning agents.

13. If any part of the spray gun is damaged (broken parts, tears) or missing then it should not be used.

14. For your own safety, only use accessories and attachments listed in the operating instructions. The use of other parts can lead to risk of injury. Only original ITW-Gema replacement parts should be used.

15. Repairs must only be carried out by specialists and under no circumstances should they be carried out in the operating area. All unauthorized conversions and modifications may lead to injury or damage to machinery. The former protection must not be reduced.

16. Conditions leading to dangerous levels of dust concentration in the powder spraying booths or in the powder spraying areas must be avoided. There must be sufficient technical ventilation available, to prevent a dust concentration of more than 50% of the lower explosion limit (UEG) (UEG = max. permissible powder/air concentration) If the UEG is not known then a value of 20 g/m$^3$ should be used.
5 A summary of the rules and regulations
The following is a list of relevant rules and regulations which are to be observed:

5.1 Guidelines and Regulations, German professional association

BGV A1  General Regulations.
BGV A2  Electrical equipment and material.
BGI764  Electrostatic coating.
BGR132  Guidelines for the avoidance of the dangers of ignition due to electrostatic charging (Guideline “Static Electricity”)
VDMA 24371  Guidelines for electrostatic coating with synthetic powder 1)  
- Part 1 General requirements.
- Part 2 Examples of use.

5.2 Leaflets
ZH 1/310  Leaflet on the use of tools in locations where there is danger of explosion. 3)

5.3 European Standards EN

RL94/9/EG  The approximation of the laws of the Member States relating to apparatus and safety systems for their intended use in potentially explosive atmospheres
EN 292-1 EN 292-2  Machine safety 2)
EN 50 014 to EN 50 020 identical DIN VDE 0170/0171  Electrical equipment for locations where there is danger of explosion 4)
EN 50 050  Electrical apparatus for potentially explosive atmospheres - Electrostatic hand-held spraying equipment 2)
EN 50 053 Part 2  Requirements for the selection, installation and use of electrostatic spraying equipment for flammable materials - Hand-held electrostatic powder spray guns 2)
PR EN 12981  Coating plants - Spray booths for application of organic powder coating material - Safety requirements
EN 60529 identical DIN VDE 04050  IP-Type protection: contact, foreign bodies and water protection for electrical equipment. 2)
EN 60 204 identical DIN VDE 0113  VDE Regulations for the setting up of high-voltage electrical machine tools and processing machines with nominal voltages up to 1000 V 3)

5.4 VDE (Association of German Engineers) Regulations

DIN VDE 0100  Regulations for setting-up high voltage equipment with nominal voltages up to 1000 V. 4)
DIN VDE 0105 Part 1  VDE Regulations for the operation of high voltage equipment. 4)
Part 4  General regulations.
DIN VDE 0147 Part 1  Setting up stationary electrostatic spraying equipment 4)
DIN VDE 0165  Setting up electrical equipment in locations where there is a danger of explosion. 4)

TECHNICAL DATA - EASYTRONIC CONTROL UNIT

Mains connection:

Input voltage: 90 - 264 V
Frequency: 47 - 440 Hz
Nominal output voltage (to gun): max. 12 V
Nominal output current (to gun): max. 1 A
Type of protection: IP 54
Temperature range: 0 °C to +40 °C
(+32 °F to +104 °F)

Approval:

Pneumatic Data

Main compressed air input: B.S.P. 1/4" (Female)
Max. Input pressure: 10 bar
Min. Input pressure: 6 bar
Max. water content of the compressed air: 1.3 g/m³
Max. oil vapour content of the compressed air: 0.1 mg/kg

Dimensions:

Width: 248 mm
Depth: 250 mm
Height: 174 mm
Weight: 5.2 kg

⚠️ IMPORTANT

The EasyTronic Control Unit can only be used with the EasySelect manual gun.
EASYTRONIC CONTROL UNIT

Field of Application

The electrostatic EasyTronic Control Unit is designed exclusively for the controlling powder coating with the EasySelect manual powder gun. This equipment is not to be used for any other purpose. Any damage resulting from its misuse is not the responsibility of the manufacturer, the entire risk is carried by the customer alone.

All settings for efficient powder coating have been made simple and reproducible on the EasyTronic. The built-in electronics permit exact setting of the optimum powder output, and the values set can be seen on the digital display windows and can even be checked from a distance. According to the selected application mode, the spray voltage is set automatically and spray current is limited automatically. The EasyTronic Control Unit can be connected to all usual mains voltages.

For a better understanding of the relationships in powder coating it is recommended to read the operating instructions of other components, thoroughly, so as to be familiar with their functions also.

Operating mode

The EasyTronic Control Unit is foreseen as standard for operation with all manual coating equipment in the EASY range. The desired functionality must, however, be determined by means of a "jumper" on the electronic board inside the control unit. If the control unit is supplied as a component of an EASY unit, then the "jumper" will be correspondingly set in the correct position at the factory.

In every other case, it is recommended to check the setting of the "jumper" (see also the corresponding section "Setting the operating mode on the electronic board ").

⚠️ NOTICE

An incorrectly set "jumper" can lead to malfunctioning or to reduced functioning of the Vibration, Fluidization or Stirrer!
DESCRIPTION OF THE EASYTRONIC CONTROL UNIT

The operating panel of the EasyTronic control unit consists of 4 main areas: Diagnostic LEDs, Displays, "+/-" Keys, and Function keys.

1. The Diagnostic LEDs 1–8 serve to show the status of the equipment, and equipment faults. Detailed information is found in the "Troubleshooting Guide"

2. There are two Displays with whose help the following values are displayed:
   - **Powder output** (Setting range 0–100 %) Powder output in % always refers to the max. possible output volume to the total air volume setting.
   - **Total air volume** (Setting range 1.6–6.0 Nm³/h)

3. The Keys "+" and "-" are for setting the powder output, and the total air volume used.
   If a key is pressed once, the value is increased or decreases, respectively, by one step. If a key is pressed continuously, the setting change rapidly.

4. The Function keys have the following functions:
   - **Electrode rinsing air for flat jet nozzles**
   - **Electrode rinsing air for round jet nozzles**
     When a key is pressed once, the corresponding function is activated, and the corresponding LED illuminates.
     If a key with an illuminated LED is pressed for longer than 1 second, the function is deactivated.
     ITW Gema recommends leaving the electrode rinsing air switched on, but can, however, remain switched off for applications with very small amounts of powder.
   - **Application keys:** With these keys the electrostatic (High-voltage, and current) are automatically set so that the setting for the selected application is the optimum.
     - Settings for flat parts
     - Settings for complicated parts with depressions
     - Settings for coating parts already coated

   High-voltage and current can be deactivated, when the corresponding key pad with the illuminated LED is pressed for longer than 1 second.

The EasyTronic control unit is switched on and off with a Push button.
If the equipment is switched on, the yellow lamp is illuminated.

When the equipment is first switched on the preselected factory settings displayed:

- **60%**
  - Flat jet rinsing
- **4.0 Nm³/h**
  - Complicated parts

After switching the equipment off (also when the equipment is disconnected from the Mains) the actual settings are retained.
INSTALLATION OF THE POWDER COATING EQUIPMENT

1. Connect the hose for the compressed air supply from compressed air circuit directly to the main air connection - **1.1 IN** on the rear of the control unit (female thread: 1/4" B.S.P.).

**NOTICE**

The compressed air must be free from oil and water.

2. Connect the black hose for the fluidizing air (if required) to the corresponding output (**1.5**) on the rear of the control unit.

3. Fit the grounding connection cable on the control unit with the grounding screw $\frac{1}{2}$, and the 5 m long grounding cable with the clamping clip to the booth or on the hanger device.

4. Connect the gun cable with the 7 pin plug on the rear of the control unit on the socket - **2.2** (Gun).

**IMPORTANT**

PG 1 Manual powder guns cannot be connected!

5. Connect the hose for rinsing air to the rinsing air output - **1.4** and to the powder gun.

6. Plug the injector in, and connect the powder hose to the injector and to the powder gun.

7. Connect the red hose for the conveying air to the corresponding output - **1.2** on the rear of the control unit and to the injector.

8. Connect the black hose for the supplementary air to the corresponding output - **1.3** on the rear of the control unit and to the injector.

9. Connect the Mains cable on the socket - **2.1**.

---

![Figure 2](https://example.com/figure2.png)
PREPARATION FOR START UP

a) Setting the Operating mode on the Electronic board

⚠️ DANGER ⚠️
The Mains plug of the EasyTronic Control Unit must be disconnected from the Mains before starting work!

The desired operating mode must be determined with a so-called "jumper" the electronic board inside the control unit.

⚠️ IMPORTANT ⚠️
If the control unit is supplied as a component of an EASY unit, then the "jumper" will be correspondingly set in the correct position at the factory.

1. Unscrew the screws on the front of the housing.

   ![Figure 3](image)

2. Hold the front plate with one hand and fit the "jumper" in the desired position:

   ![Figure 4](image)

   \[ B = \text{Easy B} \]
   \[ S = \text{Easy S} \]
   \[ F = \text{Easy F} \]

3. Replace the front plate and tighten the screws.

   *Do not over-tighten the screw!*

4. Reconnect the Mains cable.

5. Carry out a calibration:

   a) Hold all Application keys \[ \text{Application} \] pressed and simultaneously press the Main switch.

   The equipment carries out a calibration. An increase in noise can be heard inside the control unit. Both displays show \textbf{888}. After about 20 seconds the equipment is ready for operation and returns to the factory setting.
b) Preparation of the Powder hopper / container

Prepare the powder hopper or the powder container according to the type of manual equipment to be used.
(Follow the instructions in the corresponding operating manuals)

c) Switching on the Booth

Switch on the powder coating booth according to the corresponding operating instructions.

d) Function check

1. Press the push button on the control unit. The yellow control lamp in the switch illuminates.
   The equipment carries out a calibration, when it comes direct from the factory. An increase in sound can be heard inside the control unit. Both displays show 888. The equipment is ready for operation after about 20 seconds and switches to the factory settings.

2. Take the powder gun in the hand and point it at a grounded object in the booth, distance approx. 20 cm.

3. Press the gun trigger.
   LED No. 8 illuminates. The High-voltage is switched on and powder is conveyed.

If all tests are positive, the control unit, and the powder gun are ready for operation. If one of the functions does not operate as expected, check this in the ‘Troubleshooting Guide', on page 12.
DAILY START UP

a) Setting the Powder output, and Powder cloud

The powder output is dependent on the powder, and the setting of the total air volume.

Set the Total air volume

1. Switch on the control unit.
2. Set the total air volume (for more information, also see the injector Operating Instructions).
   
   The total air volume is dependent on the powder hose length, the number of turns of the hose, the hose diameter, and the object being coated.
   
   The value set for the total air volume can be left as it is, as long as the same powder hose is used. If the hose length and/or the hose diameter are changed, then the total air volume must be reset.
3. Select the powder output volume according to the desired coating thickness.
   
   The selection takes place with the aid of the + or – keys, either on the control unit or on the rear of the powder gun.
   
   To start, a standard setting of 60% is recommended. The total air volume is maintained constant automatically.
4. Check the fluidizing of the powder
5. Point the powder gun into the booth and press the powder gun trigger

Select the Powder output volume

Select the electrode rinsing

6. Select the correct electrode rinsing
   
   When using flat jet nozzles:
   - Press the key with the corresponding symbol \[\text{\textbullet}\]. The LED of the corresponding key illuminates.
   
   When using round jet nozzles with air rinsed deflector plates:
   - Press the key with the corresponding symbol \[\text{\textbullet}\]. The LED of the corresponding key illuminates.
7. Adjust the powder cloud to a test object
   
   When using flat jet nozzles:
   - Unscrew the threaded sleeve approximately 45°, so that the flat jet nozzle (or extension) can only be turned slightly
   - Turn the flat jet nozzle to the desired axial position
   - Tighten the threaded sleeve again
   
   When using round jet nozzles with air rinsed deflector plates
   - Exchange the deflector plate (ø 16, 24, and 32 mm supplied with the powder gun)
b) Powder coating

Make sure that all electrically conductive parts within 5 m of the coating booth are grounded!

1. Take the powder gun in hand and point it into the coating booth, however, do not point it at an object to be coated yet
2. Select the application setting
   - Press the corresponding application key on the control unit. The LED of the corresponding key illuminates.
3. Press the powder gun trigger
4. Coat the object(s)

c) Remote control through the Powder gun

The different functions can be remotely controlled with the aid of the + and – keys on the rear of the powder gun:

1. Select the application setting
   - Press the + and – keys on the powder gun simultaneously
   - Check by observing the LED display on the powder gun:
     - Red = Flat parts
     - Green = Complicated parts
     - Red/Green (alternating) = Spraying over
2. Change the powder output
   - Press the + or – keys on the powder gun. The powder output is correspondingly increased or decreased.

---

CAUTION

---

d) Switching off

1. Release the powder gun trigger
2. Switch off the control unit
   - The settings for high-voltage, rinsing air, and powder output are retained.

---

When the Powder coating equipment is not used for a number of days:

1. Remove the Mains plug from the Mains
2. Clean the coating equipment, see corresponding operating instructions
3. Turn off the main compressed air supply
REPAIRS TO ELECTRICAL PARTS OF THE CONTROL UNIT

The Mains plug of the EasyTronic Control Unit must be disconnected from the Mains before starting work!

a) Replacing fuse(s)

1. Unscrew the screws on the front of the housing.
2. Hold the front plate with one hand and remove the fuse(s) (quick-acting) from the fuseholder and replace with a new one.

3. Replace the front plate.
   *Do not over-tighten the screws!*
4. Reconnect the Mains cable.
5. Carry out a calibration:
   a) Hold all Application keys \[\text{Application Keys}\] pressed and simultaneously press the Main push button.
   The equipment carries out a calibration. An increase in noise can be heard inside the control unit. Both displays show 888. After about 20 seconds the equipment is ready for operation and returns to the factory setting.
b) Replacing the CG 01 Printed Circuit Board

1. Disconnect all electrical and pneumatic connections on the rear of the control unit.
2. Loosen the clamping element, dismantle the control unit and place on an level surface.
3. Unscrew the screws on the front of the housing.
4. Press the spacers together with pointed pliers and remove the printed circuit board
5. Remove the plug from the defective board and replace it on the new board.
6. Place the new board on the spacers and push them until they snap into place.
7. Reassemble the control unit in reverse order as described above.

8. Reconnect the Mains cable
9. Carry out a calibration:
   a) Hold all Application keys pressed and simultaneously press the Main push button.

   The equipment carries out a calibration. An increase in noise can be heard inside the control unit. Both displays show 888. After about 20 seconds the equipment is ready for operation and returns to the factory setting.

If there are any problems or uncertainties, please contact a ITW Gema Service Centre.
c) Replacing the Front plate

1. Disconnect all electrical and pneumatic connections on the rear of the control unit.
2. Loosen the clamping element, dismantle the control unit and place on a level surface.
3. Unscrew the screws on the front of the housing.
4. Disconnect all plugs from the front plate.
5. Unscrew the screws on the black ring and unscrew the ring.
6. Push the switch through the hole.

**Dismantle Main switch**

7. Unscrew the aluminium ring (A) and pull the push button out of the front plate.

8. Replace the front plate.
9. Fit the plugs to the new front plate.

---

**NOTICE**

With the plug X10, take note of the white marking!

10. Reassemble the front plate and control unit in the reverse order as described above.
    *Do not over-tighten the screw!

11. Reconnect the Mains cable.
12. Carry out a calibration:

    a) Hold all Application keys pressed and simultaneously press the Main push button.

    The equipment carries out a calibration. An increase in noise can be heard inside the control unit. Both displays show 888. After about 20 seconds the equipment is ready for operation and returns to the factory setting.

---

*If there are any problems or uncertainties, please contact a ITW Gema Service Centre.*
REPAIRS TO PNEUMATIC PARTS IN THE CONTROL UNIT

a) Replacing a Pneumatic Part

1. Disconnect all electrical and pneumatic connections on the rear of the control unit.
2. Loosen the clamping element, dismantle the control unit and place on an level surface.
3. Unscrew the screws on the front of the housing.
4. Remove all pneumatic tubes from the part to be replaced (see below).
5. Dismantle the defective part and replace.
6. Reconnect the pneumatic tubes (see below).
7. Reassemble the control unit in the reverse order as described above.

If there are any problems or uncertainties, please contact a ITW Gema Service Centre.

Removing the pneumatic Tubes

Before exchanging pneumatic parts all tube connections should be removed. This is done by pushing the pressure ring back, with the thumb nail, on the quick-release fitting of the tube connector. The tubing can now be withdrawn.

Refitting the pneumatic tubes

This is done by pushing the plastic tubing as far as it will go into the quick-release fitting of the hose connector. The hose is now fixed securely.

DISPLAY OF THE OPERATING TIME

A software type Timer is built into the EasyTronic Control Unit which gives information about how long the control unit has been used for coating.

In order to use this function the unit must be switched on and both rinsing air keys must be pressed simultaneously. This switches the display and the operation time can be read. The display shows the hours, with a definition of 1/10 h = 6 mins. The maximum operating time is 99999.9 h.

The Timer cannot be reset.
SPARE PARTS LIST

Ordering Spare parts

When ordering spare parts for powder coating equipment, please indicate the following specifications:

1. Type and serial number of your powder coating equipment
2. Order number, quantity, and description of each spare part

Example:

1. Type EasyTronic, Serial No.: XXX XXX
2. Order No.: 201 073, 5 pieces, Fine wire fuse

When ordering cable and hose material the length required must be given.
The spare part numbers of yard/meter ware always begins with 1... ... and are always marked with an * in the spare parts list.

Wear parts are always marked with a #.

All dimensions for plastic powder hoses are given as external diameter (o/d) and internal diameter (i/d):

e. g. ø 8 / 6 mm, 8 mm outside diameter / 6 mm inside diameter (i/d).
