SAFETY RULES

SAFETY RULES FOR ELECTROSTATIC POWDER COATING OPERATIONS

1. This equipment is dangerous when not operated according to the following standards: EN 50 050 (or VDE 0745, Part 100), EN 50 053, Part 2 (or VDE 0745, Part 102), and specification sheet, ZH 1/443 Electrostatic Powder Coating.

2. All electrostatically conductive parts located within 5 m of the coating area and especially the workpieces must be properly grounded.

3. The floor in the coating area must be electrostatically conductive. Normal concrete is generally conductive

4. The operating personnel must wear electrostatically conductive footwear (e.g. leather soles).

5. The operating personnel should hold the gun in the bare hand. If gloves are worn, they must be electrostatically conductive.

6. Connect the grounding cable (yellow/green) supplied to the grounding terminal on the control module. The grounding cable must have a good metal to metal connection with the coating booth, recovery unit, and the workpiece conveyor system, especially with the workpiece suspension.

7. The electrical and the powder feed lines to the guns must be laid out so that they are protected from possible mechanical damage.

8. The powder coating equipment should only be switched on after the booth is in operation. If the booth breaks down then the powder coating equipment must also switch off.

9. Check the grounding of all electrostatic conductive parts at least once a week.

10. When cleaning the gun or changing nozzles the control module must be switched off.
EASYSELECT-CUP MANUAL POWDER GUN

The very light EasySelect-Cup Manual Powder gun with an integrated High-voltage cascade has very good penetration and because of the patented, vented electrode a high, and constant transfer efficiency. The gun can be easily dismantled, making it maintenance and repair-friendly. It is particularly suitable for manually coating of small series especially for trails with coating powders.

SCOPE OF DELIVERY:

- EasySelect-Cup Manual Powder gun with a 6 m gun cable
- Type D100 Cup
- Pneumatic connection (Conveying air) - 6 m
- Rinsing air hose - 6 m
- 40 mm Nozzle holder
- ø 16, ø 24, and ø 32 mm vented deflector plates
- Deflector plate holder with electrode, and nozzle
- Flat jet nozzle with electrode, and holder
- Cable binding with Velcro straps
- Gun cleaning brush
- Spare parts set

Available options:
- Gun cable - 12 m
- Type D 125 Cup
- Fluidized Cup
- Pneumatic connection (Conveying air) - 12 m

TECHNICAL DATA FOR EASYSELECT-CUP MANUAL POWDER GUN

Nominal input voltage: 0–12 V DC (depending on mode and operation)
Nominal output voltage: 80 kV
Polarity: Negative (Option - Positive)
Max. Output current: 150 μA
High-voltage display: 2 Light emitting diodes - LEDs (for displaying 3 modes, and gun triggering)

Flash protection:
Approval:

*Connection: The EasySelect-Cup must only be connected to the EasyTronic Control unit.*
1 Spray Nozzle system
2 Threaded sleeve
3 Shaft
4 H-V cascade
5 End plate with hook
6 LEDs
7 Remote control keys
9 Grip
11 Powder gun cable connection
15 Conveying air hose connection
16 Rinsing air hose connection
17 Trigger
21 Setting knob
24 Venting plug (connection for fluidized cup)
27 Injector
28 Cup

Figure 1
The EasySelect-Cup Manual gun can be fitted with following Spray nozzles:

**40 mm Nozzle**
- Flat jet nozzle with vented central electrode
- Round jet nozzle with vented deflector plate and vented central electrode

**150 mm Nozzle**
*(does not belong to the standard set, available separately – see Spare parts list)*
- Extended Flat jet nozzle with vented central electrode
- Extended Round jet nozzle with vented deflector plate and vented central electrode

**300 mm Nozzle**
*(not shown - does not belong to the standard set, available separately – see Spare parts list)*
1. HIGH-VOLTAGE GENERATION

The control unit supplies DC voltage to the gun. This is fed through the powder gun cable (11) to the high-voltage generation section (4). The integrated electronics (c) in the gun generates an alternating current from the direct current. This alternating current is stepped up in the multiplier (d) to the rectified high-voltage required for the application. The High-voltage is now fed to the electrode (e) in the spray nozzle (compare Figs 5 and 6).

The coating mode chosen - Flat parts, Complicated parts, Over-spraying - is indicated through a red, and a green LED (Light emitting diode).

2. SWITCHING

In addition to the low voltage a switching current is fed into the gun through the gun cable. If the gun trigger (17) is pulled, a reed switch closes the current circuit. The control unit switches the modulated low voltage, powder conveying, and the rinsing air on. The reed switch complies with the safety regulations of all recognized standards.
3. POWDER FLOW AND RINSING AIR

The rinsing air is connected to the corresponding connection on the rear of the control unit when using vented spray nozzles (see Control unit Operating Instructions).

The function of the spray nozzles are described in the corresponding section (see page 6).
4. FLAT JET NOZZLE WITH VENTED CENTRAL ELECTRODE

The vented Flat jet nozzle serves to spray, and charge the powder. The powder cloud acquires an oval spray profile from the slotted opening. The powder is charged by means of a central electrode. The High-voltage, generated in the powder gun is fed through the black contact ring of the nozzle holder to the central electrode.

To avoid powder sintering on the electrode, it is rinsed with compressed air during spraying. The rinsing air is fed through the small hole in the black contact of the nozzle holder in the electrode holder.

The adjustment of the rinsing air on the control unit is explained in the 'Operating Instructions of the Control unit').

5. ROUND JET NOZZLE WITH VENTED DEFLECTOR PLATE AND VENTED CENTRAL ELECTRODE

In order to give the powder stream leaving the powder gun the shape of a powder cloud, a deflector plate is used. The powder is charged by means of a shaft electrode. High-voltage is generated in the powder gun, and is fed through the black contact ring of the nozzle holder to the central electrode.

Because powder sinters on the back of the deflector plate it must be rinsed with air. Rinsing air is fed through the small hole in the black contact ring of the nozzle holder in the electrode holder and so deflected that it flows over the back surface of the deflector plate. The strength of the rinsing air is dependent on the powder, and its sintering properties.

Regulation of the rinsing air on the control unit is explained in the 'Operating Instructions of the Control unit').
PREPARATION FOR START UP

A) CONNECTING THE EASYSELECT-CUP POWDER GUN

1. Connect the gun cable (2) to the control unit (see Control unit Operating Instructions)
2. Connect the conveying air hose (5) from the control unit to the gun
3. Connect the rinsing air hose (1) from the control unit to the powder gun
4. Screw the nuts and cap plug supplied (3 and 4) onto respective Supplementary air or Fluidizing air connections

---

Figure 7
B) FUNCTION CHECK

If a fault is present, see "Troubleshooting Guide", page 19. (also consult the Control unit Operating Instructions)

1. Switch on the control unit
2. Press the desired application key on the control unit. (See also the Control unit Operating Instructions).
3. Pick the gun up and point it at a grounded object, at a distance of approx. 20 cm.
4. Press the gun trigger
   - The LED No. 8 for the High-voltage display illuminates on the control unit. High-voltage is present in the EasySelect-Cup Manual Powder gun.
   - The High-voltage can be set with the corresponding keys (See also the Control unit Operating Instructions).
5. Press the gun trigger and select the powder output and total air volume.
   - The display indicates the powder output and total air volume.
6. Press the corresponding key for the rinsing air on the control unit (according to the nozzle used).

When all the checks are positive, the gun is ready for operation. When a malfunction occurs the cause of fault can determined with the aid of the "Troubleshooting Guide" page 19.
A) SETTING THE POWDER OUTPUT AND POWDER CLOUD

The powder output is dependent on the powder, and the total air volume.

1. Switch on the control unit
2. Set the Total air volume to maximum 4 m³/h
   *Selection is done with the aid the keys + and – on the control unit*
3. Select the powder output volume to 100 %
   *Selection is done with the aid the keys + and – on the control unit. The total air volume is held constant automatically.*
4. Check the fluidizing of the powder (on the fluidized Cup)
5. Point the gun into the booth and press the gun trigger
6. Turn the powder setting knob (21) on the gun clockwise to the end stop = Maximum powder output.
   *To decrease the powder output turn the knob counter-clockwise.*
7. Select the correct electrode rinsing
   *When using Flat jet nozzles*
   - Press the key with the corresponding symbol ⬤. The LED of the corresponding key illuminates.
   *When using Round jet nozzles with vented deflector plate*
   - Press the key with the corresponding symbol ⬤. The LED of the corresponding key illuminates.
8. Adjust the powder cloud on a test piece
   *When using Flat jet nozzles*
   - Loosen the threaded sleeve by turning it approx. 45°, so that the Flat jet nozzle (or extension) can barely be turned
   - Turn the Flat jet nozzle in the desired axial direction
   - Retighten the threaded sleeve
   *When using Round jet nozzles with vented deflector plate*
   - Change the deflector plate (Ø 16, 24, and 32 mm) are supplied with the powder gun.
B) START UP - POWDER COATING

**CAUTION** Make sure that all electrically conductive parts within a 5 m radius around powder coating stand are grounded!

1. Switch on the control unit.
2. Pick up the gun and hold it in the powder coating booth, however, do not point it at the object to be coated.
3. Choose the application setting
   
   *Press the corresponding application key on the control unit. The LED of the corresponding key illuminates.*

4. Press the gun trigger
5. Set the High-voltage:
   
   *High-voltage control on the LED 8 on the control unit*
6. Wait until the first powder surge has left the gun.
7. The workpieces can now be coated.

C) REMOTE CONTROL THROUGH THE GUN

The desired application setting can be selected with the aid of the remote control key on the back of the gun:

1. Press the remote control key

   *Check by observing the LED display on the injector block:*
   
   RED = Flat parts
   GREEN = Complicated parts
   RED/GREEN (alternating) = Spraying over

D) SHUTDOWN

1. Release the gun trigger.
2. Switch off the control unit

   *The settings for High-voltage, rinsing air and powder output remain in the memory.*

3. For work interruptions such as lunch breaks, overnight, etc., disconnect the compressed air supply.
MAINTENANCE SCHEDULE

Regular, and conscientious maintenance will increase the operating life of the unit and ensure a constant coating quality longer!

A) DAILY MAINTENANCE:
1a Clean the gun, see below

B) WEEKLY MAINTENANCE:
1b Clean the powder cup, injector, and gun, and if present the powder hopper. (Only fill the powder hopper shortly before starting the coating operation).
2b Check the grounding connections of the control unit with the powder coating booth, the workpiece hangers or the chain conveyor.

CLEANING AND REPAIRS

A) CLEANING

Frequent cleaning the powder gun serves to ensure the quality of the coating.

Switch off the control unit, and disconnect the gun plug (3 - Fig. 7) before cleaning the powder gun.
The compressed air used for cleaning must be free from oil and water.

Daily:
1. Empty the powder from the cup (28)
2. Unscrew the cup and clean
3. Blow off the outside of the gun and wipe clean etc.

Weekly:
4. Remove the powder hose from the connection.
5. Remove the spray nozzle from the powder gun and clean.
6. Blow the gun through with compressed air, from the connection in the direction of flow.
7. Clean the gun tube (19, Fig. 13) with the brush supplied.
8. Blow the gun through with compressed air again.
9. Reassemble the gun and connect.
10. Blow the powder hose through and clean.

3. Blow the powder hose through with compressed air

The powder hoses can be cleaned well when a foam rubber cube, from the packing material, is blown through with compressed air. Our specially designed compressed air gun (Order No. 346 055) should be used for this purpose. Foam cubes can be ordered in sheets of 100 pieces (Order No. 241 717).

4. Reconnect the powder hose to the hose connection on the injector.

IMPORTANT
B) DISMANTLING THE GUN:

⚠️ CAUTION

The gun should only be dismantled when this is made necessary by a defect or contamination.
The gun should be dismantled only so much to make the desired parts accessible.
The control unit must be switched off and the gun plug disconnected before cleaning the powder gun.
The High-voltage cascade (4) must not be dismantled, as it is assembled with a special process. Should it be defect or the shaft is broken, then the complete shaft (3) must be sent to an authorized ITW Gema Service Centre.

Figure 8
b) Dismantling the gun (cont.):

1. Unscrew the powder cup (28) and place in a safe place.
2. Loosen the fixing screws (A) and remove the injector block (27).

Figure 9
b) Dismantling the gun (cont.):
b) Dismantling the gun (cont.):
b) Dismantling the gun (cont.):

3. Place the powder tube extractor (supplied) into the powder tube, tighten the milled screw, and pull out the powder tube.

C) ASSEMBLING THE POWDER GUN

- The assembly of the gun is carried out in the reverse order to that illustrated above.
- It is to be noted, thereby, that the powder tube is to be pressed in up to the stop.
D) REPAIRS ON THE POWDER GUN

Except for the replacement of possibly defect parts, there are hardly any repairs to be made. Replacement of the cascade, and the repair of the powder gun cable connection (11 - Fig. 8) is only permitted by an authorized ITW Gema Repair Centre. Contact your ITW Gema representative.
E) CLEANING THE SPRAY NOZZLE

Daily or after every shift:

- Clean the spray nozzle externally with compressed air. Solvents or other liquids can also be used for cleaning the spray nozzle.

  **IMPORTANT**

  Only use a cloth *dipped* in solvent for cleaning, *never immerse* the parts in solvents!

- Check the seating of the spray nozzle:
  Make sure that the threaded sleeve is always well tightened. If the spray nozzle is only loosely fitted, the danger exists that the High-voltage from the powder gun can flash over, which will inevitably lead to damage to the powder gun.

Weekly:

- Remove the spray nozzle and clean inside with compressed air:
  If sintering has occur, then this must be removed.

Monthly:

- Check the spray nozzle for wear:

  Flat jet nozzles must be replaced when:
  - the spray pattern is no longer a regular oval shape.
  - there are deep grooves in the nozzle slot, or the wall thickness is no longer recognizable.
  - the wedge of the electrode holder worn away.

  Nozzles with a deflector plate:
  - when the wedge of the electrode holder is worn away, the electrode holder is to be replaced.
# TROUBLESHOOTING GUIDE

The Diagnostic LEDs 1 - 7 on the control unit illuminate green when switching on, and LED 8 remains dark. It illuminates red, only when the powder gun trigger is pulled.

<table>
<thead>
<tr>
<th>Fault</th>
<th>Causes</th>
<th>Remedies</th>
</tr>
</thead>
</table>
| LED 5 illuminates red | – The gun is not connected  
– Gun plug, gun cable or gun cable connection defect  
– Remote control on the gun defect | Connect the gun  
Replace corresponding part or send in for repair  
Replace remote control (gun cover) |
| LED 6 illuminates red | Solenoid valve for rinsing air of the Flat jet nozzle defect | Replace solenoid valve spool |
| LED 7 illuminates red | Solenoid valve for rinsing air of the Round jet nozzle defect | Replace solenoid valve spool |
| LED 8 remains dark, in spite of the gun trigger being pulled and the LED 5 illuminates green. | Gun plug, gun cable or gun cable connection defect | Replace corresponding part or send in for repair |
| The gun LED remains dark, in spite of the gun trigger being pulled and the LED 8 illuminates red. | – Gun plug, gun cable or gun cable connection defect  
– Remote control on the gun defect | Replace corresponding part or send in for repair  
Replace remote control (gun cover) |
| Powder does not adhere to the workpiece, in spite of the gun trigger being pulled and the gun sprays powder, the gun LED, and the LED 8 illuminate. | – High-voltage and current deactivated  
– High-voltage cascade defect  
– the workpieces are poorly grounded | Press the selection button (application button)  
Send the gun in for repair  
Check the grounding, see also "Directions of Use" |

SPARE PARTS LIST

ORDERING SPARE PARTS

When ordering spare parts for powder coating equipment, please indicate the following specifications:

1. Type, and serial number of your powder coating equipment

2. Order number, quantity, and description of each spare part

Example:
1. Type EasySelect-Cup Serial no: xxxx xxxx

2. Order no: 232 670, 5 pieces, O-ring - ø 13.1 x 1.6 mm

When ordering cable or hose material the lengths required must also be given.
The spare part numbers of yard/metre ware always begins with 1.. ... and are always marked with an * in the spare parts list.

Wear parts are always marked with a #.

All dimensions of plastic powder hoses are quoted as external (o/d), and internal (i/d) diameters:

  e.g.  ø 8 / 6 mm = 8 mm outside diameter (o/d) / 6 mm inside diameter (i/d).
REMARKS:

1. Only parts those which the customer can replace himself, without problems, are given in the Spare parts list.
2. Should a part of the shaft (3) be broken or the High-voltage cascade in the shaft is defect, then the complete shaft must be sent in for checking and repair. The High-voltage cascade is fitted in a special process and should, therefore, never be dismantled by the customer.
3. If the powder gun cable (11) is defect, then the complete cable is to be sent in for repair.
