Safety rules

Safety rules for electrostatic powder coating operations

1. This equipment is dangerous when not operated according to the following standards: EN 50 050 (or VDE 0745, Part 100), EN 50 053, Part 2 (or VDE 0745, Part 102), and specification sheet, ZH 1/443 Electrostatic Powder Coating.

2. All electrostatically conductive parts located within 5 m of the coating area and especially the workpieces must be properly grounded.

3. The floor in the coating area must be electrostatically conductive.
   Normal concrete is generally conductive

4. The operating personnel must wear electrostatically conductive footwear (e.g. leather soles).

5. The operating personnel should hold the gun in the bare hand. If gloves are worn, they must be electrostatically conductive.

6. Connect the grounding cable (yellow/green) supplied to the grounding terminal on the control module. The grounding cable must have a good metal to metal connection with the coating booth, recovery unit, and the workpiece conveyor system, especially with the workpiece suspension.

7. The electrical and the powder feed lines to the guns must be laid out so that they are protected from possible mechanical damage.

8. The powder coating equipment should only be switched on after the booth is in operation. If the booth breaks down then the powder coating equipment must also switch off.

9. Check the grounding of all electrostatic conductive parts at least once a week.

10. When cleaning the gun or changing nozzles the control module must be switched off.
1. EasySelect GM01-E Manual Powder gun

The very light EasySelect GM01-E Manual Powder gun with an integrated High-voltage cascade has very good penetration and because of the patented, vented electrode a high, and constant transfer efficiency. The gun can be easily dismantled, making it maintenance and repair-friendly.

1.1 Field of application

The EasySelect GM01-E Manual Powder Gun is built exclusively for the electrostatic coating with enamel powders. Any other use beyond this is not intended. The manufacturer is not responsible for any damage resulting from this; the risk for this is carried by the user alone.

1.2 Scope of delivery:

- EasySelect GM01-E Manual Powder gun
- Threaded sleeve - PU04-F-NF
- Gun cable - L = 6 m
- Rinsing air hose - L = 6 m
- Flat jet nozzle - NF05-E - complete
- Gun cleaning brush - D 12 mm
- Spare parts set

2. Technical Data for EasySelect GM01-E Manual Powder gun

Nominal input voltage: 0–10 V DC (depending on mode and operation)
Nominal output voltage: 80 kV
Polarity: Negative (Option - Positive)
Max. Output current: 150 µA
High-voltage display: 2 color Light emitting diode - (LED) (Different application settings when triggering the gun)
Flash protection: IP54
Approval: Eex 2mJ PTB No. Ex01.D.9102

Connection: The EasySelect GM01-E must only be connected to the EasyTronic CG01 / OptiTronic CG02 / 03 Control unit.
3. EasySelect GM01-E Manual Powder gun

22 Sealing plug
3.1. Spray Nozzles

The EasySelect GM01-E Manual Powder gun can be equipped with the following spray nozzles. For more information see also „Nozzle combinations for EasySelect-E“ in the Spare Parts List.

Figure 2
3.2 High-voltage Generation

The control unit supplies DC voltage to the gun. This is fed through the powder gun cable (11) to the high-voltage generation section (4). The integrated electronics (c) in the gun generates an alternating current from the direct current. This alternating current is stepped up in the multiplier (d) to the rectified high-voltage required for the application. The High-voltage is now fed to the electrode (e) in the spray nozzle (compare Figs 5 and 6).

The coating mode chosen - Flat parts, Complicated parts, Over-spraying - is indicated through a red, and a green LED (Light emitting diode).

3.3 Switching

In addition to the low voltage a switching current is fed into the gun through the gun cable.

If the gun trigger (17) is pulled, a reed switch closes the current circuit. The control unit switches the modulated low voltage, powder conveying, and the rinsing air on.

The reed switch complies with the safety regulations of all recognized standards.

![Diagram of the gun with labels for high-voltage generation and switching components]
3.4 Powder flow and Rinsing air

The rinsing air is connected to the corresponding connection on the rear of the control unit when using vented spray nozzles (see Control unit Operating Instructions).

The function of the spray nozzles are described in the corresponding section (see page 6).
3.5 Flat jet nozzle with vented central electrode

The vented Flat jet nozzle serves to spray, and charge the powder. The powder cloud acquires an oval spray profile from the slotted opening.

The powder is charged by means of a central electrode. The High-voltage, generated in the powder gun is fed through the black contact ring of the nozzle holder to the central electrode.

To avoid powder sintering on the electrode, it is rinsed with compressed air during spraying. The rinsing air is fed through the small hole in the black contact of the nozzle holder in the electrode holder.

The adjustment of the rinsing air on the control unit is explained in the ‘Operating Instructions of the Control unit’.

3.6 Round jet nozzle with vented deflector plate and vented central electrode

In order to give the powder stream leaving the powder gun the shape of a powder cloud, a deflector plate is used. The powder is charged by means of a central electrode. High-voltage is generated in the powder gun, and is fed through the black contact ring of the nozzle holder to the central electrode.

Because powder sinters on the back of the deflector plate it must be rinsed with air. Rinsing air is fed through the small hole in the black contact ring of the nozzle holder in the electrode holder and so deflected that it flows over the back surface of the deflector plate. The strength of the rinsing air is dependent on the powder, and its sintering properties.

Regulation of the rinsing air on the control unit is explained in the ‘Operating Instructions of the Control unit’.
4. Preparation for Start Up

4.1 Connecting the EasySelect GM01-E Powder gun

1. Connect the gun plug to the control unit (see Control unit Operating Instructions)
2. Connect the rinsing air hose from the control unit to the gun
3. Connect the powder hose from the powder gun to the injector

Figure 7
4.2 Function check

If a fault is present, see ‘Troubleshooting Guide’, page 17.
(Also consult the Control unit Operating Instructions)

1. Switch on the control unit
2. Press the desired application key on the control unit.
   (See also the Control unit Operating Instructions).
3. Pick the gun up and point it at a grounded object, at a distance
   of approx. 20 cm.
4. Press the gun trigger
   - The LED No. 8 for the High-voltage display illuminates on the
     control unit. High-voltage is present in the EasySelect GM01-E
   - The High-voltage can be set with the corresponding keys (See
     also the Control unit Operating Instructions).
5. Press the gun trigger and select the powder output and total air
   volume.
   - The display indicates the powder output and total air volume.
6. Press the corresponding key for the rinsing air on the control
   unit (according to the nozzle used).

When all the checks are positive, the gun is ready for operation.
When a malfunction occurs the cause of fault can determined with
the aid of the “Troubleshooting Guide” page 17.
5. Start up

5.1 Setting the Powder output and Powder cloud

The powder output is dependent on the powder, and the total air volume.

1. Switch on the control unit
2. Set the Total air volume
   The total air volume is dependent on the length of the powder hose, the number of turns of the hose, the hose diameter, the conveying air pressure, and the supplementary air. The “Functioning of the injectors and the influence of supplementary air” is described in the Injector Operating Instructions.
   The set value for the total air volume can be left as it is, as long as the same powder hose is used. If the hose length and/or the hose diameter are changed, then the total air volume must be reset.
3. Select the powder output volume in relation to the desired coating thickness.
   The selection is done with the aid the keys + and −, either on the control unit or on the remote control keys on the back of the gun.
   Before starting, it is recommended to use a standard setting of 60%. The total air volume is held constant automatically.
4. Check the fluidizing of the powder
5. Point the gun into the booth and press the gun trigger
6. Select the correct electrode rinsing
   When using Flat jet nozzles
   - Press the key with the corresponding symbol \[\text{\textcopyright}\]. The LED of the corresponding key illuminates.
   When using Round jet nozzles with vented deflector plate
   - Press the key with the corresponding symbol \[\text{\textcopyright}\]. The LED of the corresponding key illuminates.
7. Adjust the powder cloud on a test piece
   When using Flat jet nozzles
   - Loosen the threaded sleeve by turning it approx. 45°, so that the Flat jet nozzle (or extension) can barely be turned
   - Turn the Flat jet nozzle in the desired axial direction
     - Retighten the threaded sleeve
     When using Round jet nozzles with vented deflector plate
     - Change the deflector plate (ø 16, 24, and 32 mm) are supplied with the powder gun
5.2 Start up - Powder coating

Make sure that all electrically conductive parts within a 5 m radius around powder coating stand are grounded!

1. Switch on the control unit.
2. Pick up the gun and hold it in the powder coating booth, however, do not point it at the object to be coated.
3. Choose the application setting
   Press the corresponding application key on the control unit. The LED of the corresponding key illuminates.
4. Press the gun trigger
5. Set the High-voltage:
   High-voltage control on the LED 8 on the control unit
6. Wait until the first powder surge has left the gun.
7. The workpieces can now be coated.

5.3 Remote control through the gun

The different functions can be remotely controlled with aid of the keys + and – on the back of the gun:

1. Select the application settings
   Press the Keys + on the powder gun simultaneously.
   Check by observing the LED display on the powder gun:
   RED = Flat parts
   GREEN = Complicated parts
   RED/GREEN (alternating) = Spraying over

2. Change the powder output
   Press the Key + or – on the powder gun. The powder output is increased or decreased correspondingly.

5.4 Shutdown

1. Release the gun trigger.
2. Switch off the control unit
   The settings for High-voltage, rinsing air and powder output remain in the memory.
3. For work interruptions such as lunch breaks, overnight, etc., disconnect the compressed air supply.

5.5 Rinsing the powder hose

Before long idle periods residual powder must be removed from the powder hose as follows:

1. Remove the powder hose from the hose connection on the injector (see "Injector" Operating Instructions)
2. Point the manual gun in to the booth

(cont.)
6. Maintenance schedule

Regular, and conscientious maintenance will increase the operating life of the unit and ensure a constant coating quality longer!

6.1 Daily maintenance:

1a Clean the gun, see below

6.2 Weekly maintenance:

1b Clean the injector, and gun, and if present the powder hopper. (Only fill the powder hopper shortly before starting the coating operation).

2b Check the grounding connections of the control unit with the powder coating booth, the workpiece hangers or the chain conveyor.

7. Cleaning and Repairs

7.1 Cleaning

Frequent cleaning the powder gun serves to ensure the quality of the coating.

**IMPORTANT**

Switch off the control unit, and disconnect the gun plug (3 - Fig. 7) before cleaning the powder gun. The compressed air used for cleaning must be free from oil and water.

**Daily:**

1. Blow off the outside of the gun and wipe clean etc.

**Weekly:**

2. Remove the powder hose from the connection.

3. Remove the spray nozzle from the powder gun and clean.

4. Blow the gun through with compressed air, from the connection in the direction of flow.

5. Clean the gun tube (Fig. 11) with the brush supplied.

6. Blow the gun through with compressed air again.

7. Reassemble the gun and connect.

8. Blow the powder hose through and clean.
7.2 Dismantling the Gun

**CAUTION**

The gun should only be dismantled when this is made necessary by a defect or contamination. The gun should be dismantled only so much to make the desired parts accessible. The control unit must be switched off and the gun plug disconnected before cleaning the powder gun. The High-voltage cascade (4) must not be dismantled, as it is assembled with a special process. Should it be defect or the shaft is broken, then the complete shaft (3) must be sent to an authorized ITW Gema Service Centre.

Figure 8
7.2 Dismantling the gun (cont.)

Figure 9
7.2 Dismantling the gun (cont.):
7.2 Dismantling the gun (cont.):

Figure 11
7.3 Assembling the powder gun

- The assembly of the gun is carried out in the reverse order to that illustrated above.
- It is to be noted, thereby, that the powder tube is to be pressed in up to the stop.

7.4 Repairs on the powder gun

Except for the replacement of possibly defect parts, there are hardly any repairs to be made. Replacement of the cascade, and the repair of the powder gun cable connection (11 - Fig. 8) is only permitted by an authorized ITW Gema Repair Centre. Contact your ITW Gema representative.

7.5 Cleaning the Spray Nozzle

Daily or after every shift:
- Clean the spay nozzle externally with compressed air.
  Solvents or other liquids can also be used for cleaning the spray nozzle.
  **IMPORTANT**
  **Only use a cloth *dipped in solvent* for cleaning, never immerse the parts in solvents!**

- Check the seating of the spray nozzle:
  Make sure that the threaded sleeve is always well tightened. If the spray nozzle is only loosely fitted, the danger exists that the High-voltage from the powder gun can flash over, which will inevitably lead to damage to the powder gun.

Weekly:
- Remove the spray nozzle and clean inside with compressed air:
  If sintering has occur, then this must be removed.

Monthly:
- Check the spray nozzle for wear:
  Flat jet nozzles must be replaced when:
  - the spray pattern is no longer a regular oval shape.
  - there are deep grooves in the nozzle slot, or the wall thickness is no longer recognizable.
  - the wedge of the electrode holder worn away.

Nozzles with a deflector plate:
- when the wedge of the electrode holder is worn away, the electrode holder is to be replaced.
## 8. Troubleshooting guide

The Diagnostic LEDs 1 - 7 on the control unit illuminate green when switching on, and LED 8 remains dark. It illuminates red, only when the powder gun trigger is pulled.

<table>
<thead>
<tr>
<th>Fault</th>
<th>Causes</th>
<th>Remedies</th>
</tr>
</thead>
</table>
| LED 5 illuminates red | – The gun is not connected  
– Gun plug, gun cable or gun cable connection defect  
– Remote control on the gun defect | Connect the gun  
Replace corresponding part or send in for repair  
Replace remote control (gun cover) |
| LED 6 illuminates red | Solenoid valve for rinsing air of the Flat jet nozzle defect | Replace solenoid valve spool |
| LED 7 illuminates red | Solenoid valve for rinsing air of the Round jet nozzle defect | Replace solenoid valve spool |
| LED 8 remains dark, in spite of the gun trigger being pulled and the LED 5 illuminates green. | Gun plug, gun cable or gun cable connection defect | Replace corresponding part or send in for repair |
| The gun LED remains dark, in spite of the gun trigger being pulled and the LED 8 illuminates red. | – Gun plug, gun cable or gun cable connection defect  
– Remote control on the gun defect | Replace corresponding part or send in for repair  
Replace remote control (gun cover) |
| Powder does not adhere to the workpiece, in spite of the gun trigger being pulled and the gun sprays powder, the gun LED, and the LED 8 illuminate. | – High-voltage and current deactivated  
– High-voltage cascade defect  
– the workpieces are poorly grounded | Press the selection button (application button)  
Send the gun in for repair  
Check the grounding, see also “Directions of Use” |

9. Spare parts list

9.1 Ordering Spare parts

When ordering spare parts for powder coating equipment, please indicate the following specifications:

1. Type, and serial number of your powder coating equipment
2. Order number, quantity, and description of each spare part

Example:

1. **Type** EasySelect GM01-E  **Serial no:** xxxx xxxx
2. **Order no:** 232 670,  5 pieces,  O-ring - ø 13.1 x 1.6 mm

When ordering cable or hose material the lengths required must also be given.
The spare part numbers of yard/metre ware always begins with 1.. ... and are always marked with an * in the spare parts list.

Wear parts are always marked with a #.

All dimensions of plastic powder hoses are quoted as external (o/d), and internal (i/d) diameters:

- e.g.  ø 8 / 6 mm = 8 mm outside diameter (o/d) / 6 mm inside diameter (i/d).
9.2 EasySelect GM01-E Manual gun

Remarks:
1. Only parts those which the customer can replace himself, without problems, are given in the Spare parts list.
2. Should a part of the shaft (3) be broken or the High-voltage cascade in the shaft is defect, then the complete shaft must be sent in for checking and repair. The High-voltage cascade is fitted in a special process and should, therefore, never be dismantled by the customer.
3. If the powder gun cable (11) is defect, then the complete cable is to be sent in for repair.
